

makes walking easier
without losing your balance

**More dynamic
stability and control**

XRS-Technology Interaction

Xelero is different

The Xelero Internal Rocker system offers greater dynamic stability and control. This cutting edge, safe, and medically proven system supports natural gait pattern.

The patented XRS-Technology (Xelero Rock-steady Technology) contains a rocker element integrated in the midsole, the outsole remains flat. This automatically enforces a dynamic yet laterally stable flexing action without changing people's natural gait patterns.

You move in a healthy and dynamic manner without losing your balance!

The internal rocker element induces and guides the dynamic flexing action.

The control plate combines the rocker with the foundation and provides additional guidance.

The flat outsole transfers the stable, dynamic flexing action to any surface.

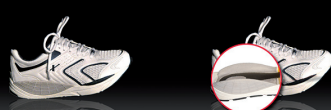

The EVA foundation and two gel pads support a comfortable, stable and accelerated heel-to-toe roll.

Xelero makes walking easier

Stability by the heel cap

The XRS-Element provides shock absorption. The heel counter is specifically formed upwards.

The XRS-System adds control, guidance and extra shock absorption.

The center of gravity shifts as a consequence of the natural gait. The internal rocker continues the forward motion

The control plate provides a stable platform for toe off. The body is dynamically shifted forward and the foot takes off.

**makes walking easier
without losing your balance**

Xelero makes walking easier

Xelero is the first health care shoe that systematically combines stability with a dynamic flexing action – by means of the XRS-Technology. Xelero is the perfect walking shoe, and is ideally suited for lengthy activities such as standing or working.

Optimally suited for orthopedic insoles

The Xelero XRS Technology adheres to scientifically sound biomechanical principles: Each Xelero shoe is optimally suited for orthopedic insoles and fully comprises the unique advantages of the XRS-Technology. Orthopedic insoles, dynamic flexing action and stability – only by Xelero.
